RESULTS
Calculate the mean absorbance for each control and unknown.

Qualitative results:
If the absorbance of the sample is higher than that of the Cut-Off, the sample is positive for the presence of specific IgG. Calculate the ratio between the average OD value of the sample and that of the Cut-Off. The sample is considered:
- Positive: if the ratio is > 1.1.
- Doubtful: if +/- 10% of the Cut-Off.
- Negative: if the ratio is < 0.9.
If the result is doubtful, repeat the test. If it remains doubtful, collect a new serum sample.

LIMITATIONS OF THE PROCEDURE
- A serum sample obtained during the early phase of infection, when only IgM antibodies are present, may be negative by this procedure.
- The test result should be used in conjunction with information available from the evaluation of other clinical and diagnostic procedures.
- Avoid repeated freezing and thawing of reagents and specimens.
- Grossly hemolyzed, icteric or lipemic specimens should be avoided.
- Heat inactivated sera should be avoided.

QUALITY CONTROL
Subtract the value of the blank from all the other readings. The OD values of Cut-off control must be at least 0.2.
Positive control must have an OD at least 1.5 times that of Cut-off.

PERFORMANCE CHARACTERISTICS

1. **Sensitivity and Specificity**
103 human sera were analyzed by this Varicella IgG Elisa and a commercial Elisa (Test A) as reference method. Out of 103 samples, 89 were positive for the presence of IgG-antibodies to Varicella zoster virus by DIAsource Elisa and commercial Elisa showed 79 of them as positive. The results are summarized below.

REFERENCE
For PRECAUTIONS

One bottle, 15 mL, containing 0.3 M H2SO4 in solution. Store at 2-8°C until expiration date.

Store at 2-8°C until expiration date.

One bottle, 12 mL, containing anti-human IgG monoclonal antibodies eroxidi with eroxidise, in a phosphate buffer solution with 0.02% Proclin. Store at 2-8°C until expiration date.

WARNING: POTENTIAL BIOHAZARDOUS MATERIAL

The following universal Good Laboratory Practices should be observed:

- Microtiter plate reader capable of absorbance measurement at 450 nm
- Deionized/ Distilled water
- Precision pipette to deliver 10 µL, 100 µL, and 1 mL
- Semi-automatic pipette to deliver 100 µL
- Automatic microtitration plate washer
- Absorbent materials for blotting the strips
- Incubator capable of maintaining temperature at 37°C

Microbiological and Biomedical Laboratories, “4

Weeks at 2-8°C.

The material in this kit has been tested by CE marked methods and found to be non-reactive for infectious human material in the Centers for Disease Control/National Institutes of Health manual “Biosafety in microtitration plates.”

This kit may contain some reagents made with human source material (e.g. serum or plasma) or used in conjunction with infectious human material. The kit is not for use with patient samples.

Some of the reagents in this kit contain sodium azide as a preservative at concentrations below the regulatory limit of < 0.1%. Although significantly diluted, concentrated sodium azide is an irritant to skin and mucous membranes, and may react with lead and copper plumbing to form explosive metal azides, especially if accumulated. Additionally, TMB and Sulfuric Acid, in concentrated amounts are also irritants to skin and mucous membranes. These substances are in diluted form and therefore may minimize exposure risks significantly but not completely. Provide adequate ventilation. Avoid contact with skin, eyes and clothing. In case of contact with any of these reagents, wash thoroughly with water and seek medical advice. Dispose all nonhazardous reagents by flushing with large volumes of water to prevent buildup of chemical hazards in the plumbing system.

For further information regarding hazardous substances in the kit, please refer to the component specific MSDS by request.

For PRECAUTIONS

One bottle, 100 ml, containing a protein solution with 0.09% sodium azide as a preservative. Store at 2-8°C until expiration date.

Varicella IgG Controls

Three vials, negative, cut off and positive, each 2 mL of human serum in a 0.01 M phosphate buffer with 0.09% sodium azide as a preservative. Store at 2-8°C until expiration date.

2nd Antibody Conjugate

One bottle, 12 mL, containing anti-human IgG monoclonal antibodies eroxidi with eroxidise, in a phosphate buffer solution with 0.02% Proclin. Store at 2-8°C until expiration date.

TMB-Substrate

One bottle, 12 mL, containing tetramethylbenzidine (TMB) and hydrogen peroxide stabilized in citrate buffer, pH 3.8. Store at 2-8°C until expiration date.

Stopping Solution

One bottle, 15 mL, containing 0.3 M H2SO4 in solution. Store at 2-8°C until expiration date.

PRECAUTIONS

For in vitro use

The following universal Good Laboratory Practices should be observed:

- Pipette 100 µL of serum into 1 mL of Sample Diluent.
- Serum should be used, and the usual precautions for venipuncture should be observed. Specimens may be stored at 2-8°C for 2 days. For longer periods, store at -20°C. Do not use hemolyzed or lipemic specimens. Avoid repeated freezing and thawing of samples.

PREPARATION FOR ASSAY

A thorough understanding of this package insert is necessary for successful use of the product. Reliable results will only be obtained by using precise laboratory techniques and accurately following the package insert. Bring all kit reagents and specimens to room temperature (25°C) before use. Thoroughly mix the reagents and samples before use by gentle inversion. Do not mix various lots of any kit component within an individual assay. Do not use any component beyond the expiration date shown on its label. Incomplete washing will adversely affect the outcome and assay precision. To minimize potential assay drift due to variation in the substrate incubation time, care should be taken to add the stopping solution into the wells in the same order and speed to add the TMB Chromogen Solution. A void microbial contamination of reagents, especially of the conjugate, wash buffer and diluent. A void contamination of the TMB Chromogen Solution with the Conjugate. Use a clean disposable pipette tip for each reagent. A void pipettes with metal parts. Containers and semi-automatic pipette tips used for the Conjugate and TMB can be reused provided they are thoroughly rinsed with deionized/distilled water and dried prior to and after each usage. The enzyme used as the label is inactivated by oxygen, and is highly sensitive to microbial contamination, sodium azide, hypochlorous acid and aromatic chlorohydrocarbons often found in laboratory water supplies. Use high quality water. A void exoures of the reagents to excessive heat or sunlight during storage and incubation.

PREPARATION OF REAGENTS

Wash Solution

Dilute 1:10 with deionized/distilled water prior to use. If crystals are present, they should be dissolved at 37°C before dilution. Pour 100 mL of the Wash Concentrate into a clean container and dilute by adding 900 mL of deionized/distilled water. Mix thoroughly by inversion. The wash solution is stable for 5 days at room temperature and 2 weeks at 2-8°C when stored in a tightly sealed bottle.

Microtitration Strips

Select the number of coated strips required for the assay. The remaining unused wells should be placed in the resealable pouch with a desiccant pack. The pouch must be resealed to protect from moisture.

Assay Procedure

All specimens and reagents to reach room temperature (25°C) before use. Serum Samples and Controls should be assayed in duplicate.

1. Mark the microtitration strips to be used.
2. Dilute serum samples 1:10 diluting 10 µL of serum into 1 mL of Sample Diluent.
3. Pipette 100 µL of each diluted serum sample and ready to use controls to the appropriate wells. Leave one well for the blank, performed using 100 µL of the TMB-substrate at the substrate incubation step.
4. Incubate for 45 minutes at 37°C.
5. Aspirate and wash each well four (4) times for 30 seconds with Washing Solution using an automatic microplate washer or manually using a dispenser. Blot and dry by inverting plate on absorbent material.
6. Dispose 300 µL of the Wash Solution into each well, and (repeat step (a) and (b) four times.
7. Add 100 µL of Enzyme-Labeled 2nd Antibody Conjugate into each well.
8. Incubate for 15 minutes at room temperature. Avoid exposure to direct sunlight.
9. Add 100 µL of Stopping Solution to each well using a dispenser.
10. Read the absorbance of the solution in the wells within 30 minutes, using a microplate reader set to 450 nm. If wavelength correction is available, select the instrument to dual wavelength measurement at 450 nm with background wavelength correction set at 600 or 620 nm.
